Description:      
Next-generation drug-eluting stent is advantageous as it offers improved deliverability by using materials like cobalt chromium, cobalt nickel, and cobalt alloy, this results in significant reduction in strut width, and enhance stent flexibility. In next-generation drug eluting stent, several drugs are coated in stents to address multiple restenosis pathways by altering drug release kinetics that mimics restenosis cascade. In addition, next-generation drug-eluting stent utilizes bioabsorbable polymers to reduce complications of late stent thrombosis, and biodegradable drug-eluting scaffold plays a vital role in transforming coronary artery disease treatment.

The market in North America is anticipated to show the largest market share for the next-generation drug-eluting stent, followed by Europe, owing to the high prevalence and incidence of coronary artery disease.
