Basal cell carcinoma has a low metastasis rate and is more benign, so it is also called basal cell epithelial tumor. Based on its greater destructiveness, it is also called invasive ulcer. Basal cell carcinoma is more common in the elderly, and it occurs in the head, face, neck and back of the hand, especially the prominent part of the face. It begins with a small nodule that is skin-to-dark-infiltrated, typically waxy, translucent nodules with high curled edges. The central part begins to rupture, with black necrotic pustum, and the central necrosis spreads to the deep tissue, showing large invasive necrosis, which can reach soft tissue and bone tissue. Among the many treatments, surgical resection is still the most effective treatment for the complete eradication of basal cell carcinoma and avoiding tumor recurrence. In addition to surgical resection, other methods that can be used to treat basal cell carcinoma include: radiation therapy, photodynamic therapy, scraping electrocautery, cryotherapy, topical application of drugs, etc. The global Basal Cell Carcinoma Treatment market was valued at 4520 million US$ in 2018 and will reach 9090 million US$ by the end of 2025, growing at a CAGR of 9.1% during 2019-2025.
