Ureteroscopy is an examination of the upper urinary tract, usually performed with a ureteroscope that is passed through the urethra and the bladder, and then directly into the ureter; usually the lower 2/3 of the ureter is accessible by this procedure. North America is expected to command the largest share of the flexible ureteroscope market. The large share of this market segment can be attributed to the high prevalence of kidney stones in this region and the large number of surgeries performed each year. However, the high cost of ureteroscopy procedures is expected to restrain the growth of this market during the forecast period.
