Anthracene is a product of coal tar, which is a by-product collected from carbonization of coal. Coal tar includes about one and a half percent of anthracene. It is colorless in nature, but exhibits a blue fluorescence under ultraviolet light. Thus, it is used in production of red dye alizarin and other dyes. Anthracene is first converted into anthraquinone; which is the product used in preparation of dye.

Coming to regional markets, the U.S. has been, historically, a dominant importer of coal tar from countries, such as, Netherlands, France and Germany. Apart from these, China and Europe are the other dominant regions, as of today. However, EU is expected to have a stagnant growth in future, corresponding to the resolution passed to ban PAH, as mentioned above.
