UV-Curable Adhesives is a adhesives in which ultraviolet light and visible light is used to initiate a photochemical reaction. UV adhesives are produced using a variety of resins such as acrylic, polyurethane, silicone, epoxy and others. Among these the high bond strength provided by acrylic makes it the most widely accepted and used product type. Acrylic not only offers optical clarity, but is low in price. Adhesives based on acrylic resins are known for durability, strength, low maintenance, resistance to chemicals, etc. With the growing demand from the automotive and industrial end-users, the market for UV-cured adhesives is to grow through the forecast period.

Asia-Pacific to Lead the UV-Curable Adhesives Market. Growth in disposable income, and higher per capita expenditure on social and cultural factors are a few factors fueling up the demand in the Asia-Pacific market. Also, there is a rise in the government funding for public welfare in the region. The recent advancements in the adhesives technologies are aiding automobile manufacturers in the production of lightweight and fuel-efficient vehicles. Furthermore, it has been observed that during new car assessment programs and crash tests, vehicles bonded with adhesives perform better, compared to welded vehicles, as they do not affect the substrate used in the automobile assembly. This is further increasing the use of UV-curable adhesives in the automotive sector.
