The human immunodeficiency virus (HIV) refers to a type of retrovirus that causes acquired immunodeficiency syndrome (AIDS). HIV attacks some immune cells and causes weakness of immune system resulting in loss of ability to fight against the organism that causes disease.

HIV spreads through fluidic exchange with some infected person such as blood transfer or sharing needles with someone who is HIV-infected. In addition, HIV can spread from infected mother to child during pregnancy. Some of the symptoms of HIV infection are slight fever, fatigue, swollen glands, headaches and muscle aches.

HIV infection has no cure but there are treatments which help to stabilize or reduce this infection so that it does not lead to AIDS.

HIV therapeutics market is growing at a significant rate due to increase in the HIV infected cases and growing awareness about the same. HIV infection can be treated by various therapeutics such as nucleoside/nucleotide reverse transcriptase inhibitor, integrase inhibitor, HIV-1 protease inhibitor, non-nucleoside reverse transcriptase inhibitor, pharmacokinetic enhancer and entry inhibitor.
