MSVAS is an early warning system for a motorcycle rider, which constantly monitors the rider's blind spots and helps in lane changing decisions. The current MSVAS consists of a sensor array, with a sensor placed at each strategic location at the front and rear ends of the motorcycle.

While the rear sensors are used for monitoring the blind spots in the current and surrounding lanes as an extra-sensory source of information, the front sensors on the other hand are for a plausibility check, as well as to ascertain the direction and lane of the traffic being tracked.
