The ophthalmic guidewire is designed to navigate vessels to reach a lesion or vessel segment. Once the tip of the device arrives at its destination, it acts as a guide that larger catheters can rapidly follow for easier delivery to the treatment site. The ophthalmic guidewire is characterized by their usability, steerability, torque, and opacity. Pushability is the amount of force needed to advance the wire. Steerability is the ability and responsiveness of the wire tip to navigate vessels. Torque is the response of the cable to turning by the operator when navigating vessels. Its opacity is its level of visibility under fluoroscopic imaging. The primary functions of the Ophthalmic Guidewire are to access the lesion, to cross the lesionatraumatically, to provide support for interventional devices and the has ability to bend with direct pressure. Ophthalmic guidewire has an ability to follow the wire tip around curves and bends without bucking or kinking, to navigate anatomy of the vasculature.
