Brake Pads are components of brake systems used in automotive and other applications. Brake pads are friction materials which bind to the surface that faces the brake rotor and take the brunt of the frictional force necessary to stop the car. In a disc brake system, the brake pedal activates a hydraulic line which squeezes the calipers against the rotors of the car’s tires. Pads are positioned between the calipers and the rotors to absorb the energy and heat, and then provide enough grips to stop the car. Brake pads are often described as brake linings or brake shoes and when applied to the brake rotors or drums, respectively, with a mix of hydraulic and mechanical force, supply the friction to safely bring the car to a halt. Brake pads are usually used in disc brake setups within a hydraulic brake caliper and are squeezed versus the brake disc, or rotor in order to stop the car when using the brakes.

Note: In the report, one unit Brake Pads represents two pieces Brake Pads.
