Computed tomography refers to a digitalized X-ray imaging procedure used to diagnose the internal organs, bones, soft tissue, and blood vessels by creating their detailed image. CT scanning helps detect different types of cancers by enabling the doctors to confirm the presence of a tumor and determine its size and location. The major factors that fuel the growth of the market are the increase in shift of medical care toward image guided interventions and technological improvement in image processing and resolution. In addition, emphasis on less invasive procedures for diagnosis as well as rise in popularity of automated workflow in emergency clinical setting supplement the market growth.
