Cancer molecular biomarkers refer to naturally-occurring molecules or genes in living organisms, which is an indicator for the presence of cancer in the body. A biomarker is a measurable indicator of biological process, condition, or disease and can be found in the blood, tissues, or other body fluids. Cancer molecular biomarkers help to diagnose cancer and monitor patients’ responses to treatments.

Factors such as technological advancements, increasing research and development activities, increase in funding from various government and non-government organizations, rise in healthcare expenditure, non-invasive technology, increasing incidences of cancer, and streamlined drug delivery process are expected to drive the market for cancer molecular biomarkers. In addition, growing survival rates and increased accuracy of diagnosis with the help of biomarkers are expected to drive market for cancer molecular biomarkers.
