Description:
Chloroprene rubber (hereinafter: CR; synonym: polychloroprene or sometimes Neoprene) is a synthetic rubber produced by polymerization of chloroprene. It is an artificially-made polymer acting as an elastomer. Chloroprene rubber exhibits good chemical stability, and maintains flexibility over a wide temperature range. It is used in a wide variety of applications, such as laptop sleeves, orthopedic braces (wrist, knee, etc.), electrical insulation, liquid and sheet applied elastomeric membranes or flashings, and automotive fanbelts.

Asia Pacific is expected to be the largest and fastest growing market for chloroprene rubber owing to surging demand from China in diverse automobile and industrial component applications. North America and Europe are anticipated to witness significant growth following Asia Pacific on account of increasing population and rapid industrialization over the forecast period. Extensive R&D in terms of replacing smoked rubber suppression with vulcanization in chloroprene manufacturing process owing to benefits including retention of elastic memory and nonabsorbent properties are expected to provide extensive growth potential to key market participants.

The global Chloroprene Rubber market was valued at xx million US$ in 2018 and will reach xx million US$ by the end of 2025, growing at a CAGR of xx% during 2019-2025.
