Gastrointestinal stents consist of stents that include trans-hepatic, esophageal, biliary stents, pancreatic and duodenal stents. The stents are used during colorectal cancer, inflammatory bowel disease, GI bleeding, and other diseases.

Based on material, the self-expanding metal stents segment accounted for the largest share of the global gastrointestinal stent market in 2017. The large share of this segment can be attributed to their ease of insertion, a lower possibility of dislodgment or migration, its longer patency because of the large luminal diameters, high longevity, and large use of it in interventional endoscopy for various malignant obstructions.

The global gastrointestinal stent market, by end user, is segmented into hospitals and ambulatory surgery centers. In 2017, the hospitals segment accounted for the largest share of the market. The large share of this segment can be attributed to the large number of endoscopic procedures performed in hospitals for various gastrointestinal diseases.

North America accounted for the largest share of the global market in 2017, followed by Europe and Asia Pacific. The highly developed healthcare system, rising geriatric population, growing adoption of technologically advanced stents, and the presence of key players are the major factors responsible for the large share of North America in the global market.

The global Gastrointestinal Stents market was valued at xx million US$ in 2018 and will reach xx million US$ by the end of 2025, growing at a CAGR of xx% during 2019-2025.
