Pendulum feeder is installed under the storage tank or hopper to convey the materials with particle size less than 50mm and the materials that are dry and not easy to agglomerate such as ore stones, coal blocks etc. It is not suitable to convey powder which is easy to block feeding, and makes powder fly. Minerals fall in the ore feeding box from ore bin. When it works, via coupler, electric motor drive turbine reducer to operate; the pendulum plate of chute begin the reciprocal movement through eccentric wheel on the output shaft of turbine reducer. So, the mineral feeding process is finished. The mineral feeding quantity can be controlled by adjusting eccentric wheel or regulating the revolving speed of motor.
