Apple Juice Concentrate (AJC) is produced at 70-71 brix at low acidity from apples. This product can be used in fruit juices and tea. The juice concentrate is processed to remove a defined proportion of the natural water content found in the fruit and produce a concentrated product which is smaller in volume. This can greatly reduce the costs required for transportation and the concentrate can, if required, be returned to its single-strength state by reconstituting with water once it reaches the final processing destination.
