Bearings are machine elements used to reduce energy loss caused by friction in the rotary parts of a broad range of equipment and machinery. There are several types of bearings such as ball bearings, roller bearings, plain bearings, and others. Technological advances and the growing need to address energy efficiency in a range of applications are leading to a continuous improvement in bearing designs. Therefore, the prospects for market growth of bearings are closely linked to the growth in production of high-performance industrial equipment and machinery.

According to the report, increase in rotor diameter will be a key driver for market growth. Unlike conventional power plants, wind energy generation is highly dependent on meteorological conditions, especially wind speed. The maximum energy that can be harnessed by a wind turbine is roughly proportionate to the swept area of the rotor.

The global Wind Turbine Bearing market was valued at xx million US$ in 2018 and will reach xx million US$ by the end of 2025, growing at a CAGR of xx% during 2019-2025.
